## Stopping the Global Warming Example

The environment as of now causes everyone to be in trouble. By stopping the global warming, Citizens should learn how to reduce the use of plastic, plant more trees, and consume energy wisely. First, Global warming means the increase of the temperature of the earth's atmosphere. Therefore, by using less plastic, citizens could contribute to the eco-system disruption. Plastics are very durable, cheap, and can even last for a lifetime. But over the years, a lot of things are changing just because of plastic. There was an incident wherein a lot of turtles have died since they have eaten a plastic bag because they thought it was a jellyfish that they could eat. Not only the animals in the world are being affected but also the mother nature itself. Citizens should know when and how to use the plastic bags in a proper manner.

As for myself, as much as possible, I help to minimize the plastic pollution by using a metal straw, spoon, and fork. I bring it every day with me so whenever I go out to get food, I don't have to ask for disposable plastic utensils and I could also help save the environment. Bringing our own eco bag or what we call reusable grocery bags every time we shop or do some groceries to stop the destruction of our eco-system. Ever heard of the 3 R's? It means Reduce, Reuse, Recycle.

Every product that we use, buy, etc. has a label if it can be reused or recycled. Reduce means reducing the products that people should buy and avoiding the products with too much packaging. All these plastics can last for a lifetime and may affect the environment. Secondly, to reuse, wherein people can use again the stuff that is reusable and does not break easily. Lastly, recycle. There are a lot of kinds of stuff that citizens could recycle just like, papers, cans, plastic, glass, etc. It could make new things like toys or even clothes. It would reduce almost fifty percent of the material that can all go to waste. We should look for items that can be recycled instead of the items that cannot be used anymore because it can save more money and could be much more convenient. Therefore, by using fewer plastics, citizens could help the world be a better place to live in.

As our climate changes and causes global warming, We, Citizens should make an act by planting more trees around the world. As we all know, Trees absorb the carbon dioxide from the air and release oxygen into the atmosphere. Around my community, I was worried when I saw that all the trees and plants are cut down because they would build more houses around the area. I can't imagine how much trees were lost and that there was a thing on my head that keeps on bugging me. I know the fact that we can get so much flood in the area because of all the trees that were cut down. That's why what I do as much as possible, I plant my own plants and let it grow so that even if it's just a small thing to do, I can still be able to help my community.

Trees provide a lot of benefits to all the citizens in the world just like preventing soil erosion, adding beauty to our community, help flying animals have a place to live, can give us a cooling shade and help clean the water. The country of Pakistan plans to plant billions of trees to help fight the climate change and restore all empty forest that was affected. They plan to plant trees to help reduce the risk of flooding from the melting glaciers and to protect the fast eroding landscape in Pakistan. These small acts can help stop the global warming. All of us should make a stand and act now. Finally, by consuming the energy wisely, Citizens should know how to use all these things in a proper way. We use energy every day, using our cars, turning on the lights, cooling our homes, manufacturing the foods that we eat every day, etc. In my culture, almost all Filipinos don't use showers when taking a bath. We have a dipper and pail when we take a bath. Every time we need to wash our body, we turn on the faucet and once the pail gets full, we turn it off to reduce wasting water. We also don't have a heater, we are

used to taking a bath with a cold water.

## Conclusion

By these small things that we do, we are helping the community to use less energy as much as possible. When saving energy, it means that we consume less wherein It will also lessen the carbon dioxide that can be released into the atmosphere. A lot of houses that are being built right now have solar panels that are readily possible and available to use. Solar Panels helps reduces air pollution, water pollution, and the need for resources. By using Solar Panels, we can get the energy source straight from the sun that can be used repeatedly. It also helps us to save so much money that instead of paying for electrical bills, we can just save it or set it aside to pay other important stuff. To conclude the essay, Citizens can use a lot of ways to stop the global warming. We can't see everything right now but as much as years passed by, there are too much in this world that causes our Mother Nature to die. We, humans, are all responsible for what goes on the world right now. If we do not act today, what will happen to the future? Imagine all the babies, that are being born today, do they deserve all of this? We need to change our thinking and help our community, our place, our world, to restore all the things that are lost and help the society in engaging new capabilities that can discover better ways on how to stop global warming.
